

Hands-on Tutorial

1. Basic information towards Jupyter Notebook, Google Colab

Jupyter Notebook resources: <https://realpython.com/jupyter-notebook-introduction/>

Google Colab: https://www.tutorialspoint.com/google_colab/what_is_google_colab.htm

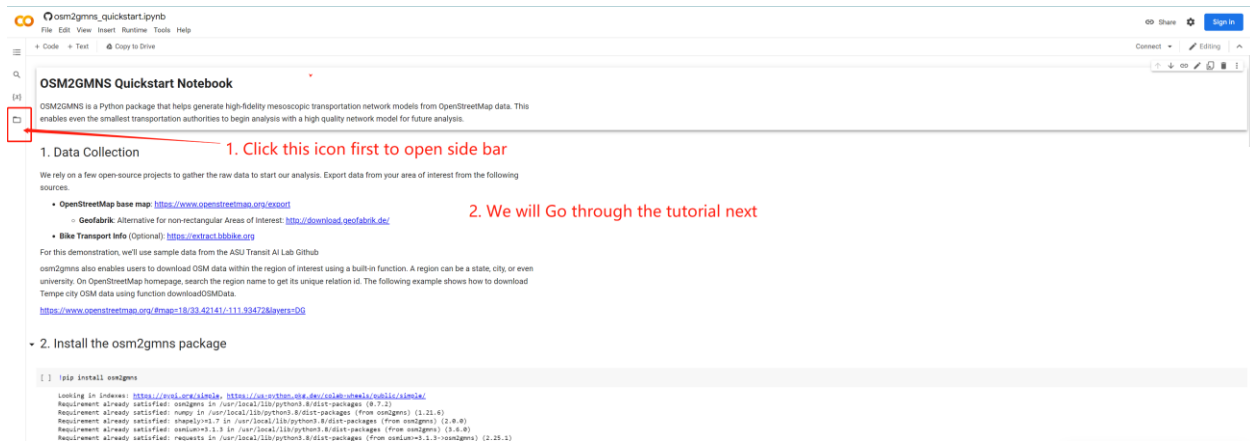

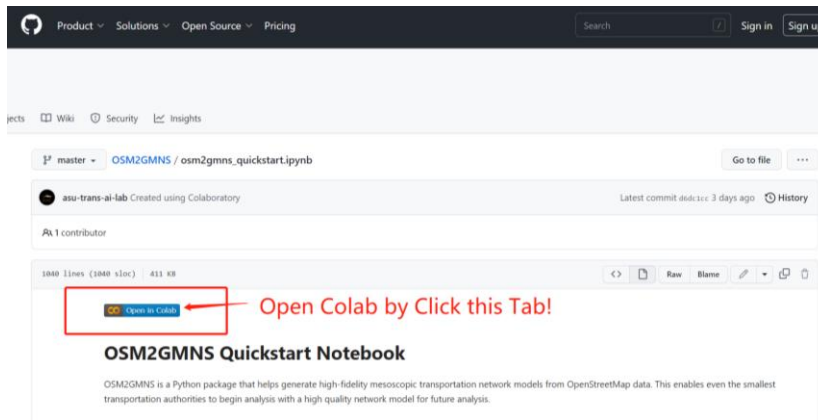

Virtual Machine: <https://www.vmware.com/topics/glossary/content/virtual-machine.html>

2. Get familiar with Google Colab (osm2gmns as example)

2.1 Find the tutorial document:

https://github.com/asu-trans-ai-lab/OSM2GMNS/blob/master/osm2gmns_quickstart.ipynb

2.2 You will find *Open in Colab* button, click it.

3 Tutorial: Let's Start with osm2gmns

3.1 Install Package

OSM2GMNS Quickstart Notebook

OSM2GMNS is a Python package that helps generate high-fidelity mesoscopic transportation network models from OpenStreetMap data. This enables even the smallest transportation authorities to begin analysis with a high quality network model for future analysis.

1. Data Collection

We rely on a few open-source projects to gather the raw data to start our analysis. Export data from your area of interest from the following sources:

- **OpenStreetMap base map** <https://www.openstreetmap.org/export>
- **Geofabrik**: Alternative for non-rectangular Areas of Interest: <http://download.geofabrik.de/>
- **Bike Transport Info (Optional)** <https://exact.bbbike.org>

For this demonstration, we'll use sample data from the ASU Transit AI Lab Github

osm2gmns also enables users to download OSM data within the region of interest using a built-in function. A region can be a state, city, or even university. On OpenStreetMap homepage, search the region name to get its unique relation id. The following example shows how to download Tempe city OSM data using function downloadOSMData.

<https://www.openstreetmap.org/#map=18/33.42141/-111.93472&layers=DG>

2. Install the osm2gmns package

```
[1] 1 !pip install osm2gmns
```

Looking in indexes: <https://pypi.org/simple>, <https://us.pytorch.org/de/colab-wheel/public/simple/>

Requirement already satisfied: osm2gmns in /usr/local/lib/python3.8/dist-packages (0.7.2)

Requirement already satisfied: numpy in /usr/local/lib/python3.8/dist-packages (from osm2gmns) (1.21.4)

Requirement already satisfied: shapely>=1.7 in /usr/local/lib/python3.8/dist-packages (from osm2gmns) (2.0.4)

Requirement already satisfied: osmium>=1.3.0 in /usr/local/lib/python3.8/dist-packages (from osm2gmns) (1.4.4)

Requirement already satisfied: requests in /usr/local/lib/python3.8/dist-packages (from osmium>=1.3.0->osm2gmns) (2.28.1)

Requirement already satisfied: charset-normalizer in /usr/local/lib/python3.8/dist-packages (from requests>osmium>=1.3.0->osm2gmns) (2.0.9)

Requirement already satisfied: certifi>=2017.4.17 in /usr/local/lib/python3.8/dist-packages (from requests>osmium>=1.3.0->osm2gmns) (2022.12.7)

Requirement already satisfied: idna>=2.5 in /usr/local/lib/python3.8/dist-packages (from requests>osmium>=1.3.0->osm2gmns) (3.34)

Requirement already satisfied: urllib3>=1.27,<=1.26.1 in /usr/local/lib/python3.8/dist-packages (from requests>osmium>=1.3.0->osm2gmns) (1.26.1)

3. Create a network model from OpenStreetMap exports

```
[2] 1 # Import osm2gmns with the alias as "og" (easier to type)
2 import osm2gmns as og
3 # relation id for Tempestar is 8308134
4 # relation id for City of Tempe is 110833
5 og.downloadOSMData(110833, "map.osm")
6 # Generate a net from the Tempe, AZ OpenStreetMap export and include Points of Interest (POI=True)
7
```

valid responses got from API server.
receiving data.
map data has been written to map.osm

1. The introduction to osm2gmns

2. You can download data from OpenStreetMap manually from here, but for this time, you don't need to download the OpenStreetMap. This is just in case you want to look at a specific area that you like.

3. This is where the assignment will start.

OSM2GMNS Quickstart Notebook

OSM2GMNS is a Python package that helps generate high-fidelity mesoscopic transportation network models from OpenStreetMap data. This enables even the smallest transportation authorities to begin analysis with a high quality network model for future analysis.

1. Data Collection

We rely on a few open-source projects to gather the raw data to start our analysis. Export data from your area of interest from the following sources:

- **OpenStreetMap base map** <https://www.openstreetmap.org/export>
- **Geofabrik**: Alternative for non-rectangular Areas of Interest: <http://download.geofabrik.de/>
- **Bike Transport Info (Optional)** <https://exact.bbbike.org>

For this demonstration, we'll use sample data from the ASU Transit AI Lab Github

osm2gmns also enables users to download OSM data within the region of interest using a built-in function. A region can be a state, city, or even university. On OpenStreetMap homepage, search the region name to get its unique relation id. The following example shows how to download Tempe city OSM data using function downloadOSMData.

<https://www.openstreetmap.org/#map=18/33.42141/-111.93472&layers=DG>

2. Install the osm2gmns package

```
[1] 1 !pip install osm2gmns
```

Looking in indexes: <https://pypi.org/simple>, <https://us.pytorch.org/de/colab-wheel/public/simple/>

Requirement already satisfied: osm2gmns in /usr/local/lib/python3.8/dist-packages (0.7.2)

Requirement already satisfied: numpy in /usr/local/lib/python3.8/dist-packages (from osm2gmns) (1.21.4)

Requirement already satisfied: shapely>=1.7 in /usr/local/lib/python3.8/dist-packages (from osm2gmns) (2.0.4)

Requirement already satisfied: osmium>=1.3.0 in /usr/local/lib/python3.8/dist-packages (from osm2gmns) (1.4.4)

Requirement already satisfied: requests in /usr/local/lib/python3.8/dist-packages (from osmium>=1.3.0->osm2gmns) (2.28.1)

Requirement already satisfied: charset-normalizer in /usr/local/lib/python3.8/dist-packages (from requests>osmium>=1.3.0->osm2gmns) (2.0.9)

Requirement already satisfied: certifi>=2017.4.17 in /usr/local/lib/python3.8/dist-packages (from requests>osmium>=1.3.0->osm2gmns) (2022.12.7)

Requirement already satisfied: idna>=2.5 in /usr/local/lib/python3.8/dist-packages (from requests>osmium>=1.3.0->osm2gmns) (3.34)

Requirement already satisfied: urllib3>=1.27,<=1.26.1 in /usr/local/lib/python3.8/dist-packages (from requests>osmium>=1.3.0->osm2gmns) (1.26.1)

3. Create a network model from OpenStreetMap exports

```
[ ] 1 # Import osm2gmns with the alias as "og" (easier to type)
2 import osm2gmns as og
3 # relation id for Tempestar is 8308134
4 # relation id for City of Tempe is 110833
5 og.downloadOSMData(110833, "map.osm")
6 # Generate a net from the Tempe, AZ OpenStreetMap export and include Points of Interest (POI=True)
7
```

valid responses got from API server.
receiving data.
map data has been written to map.osm

1. Hover your mouse over this area and the play icon will appear. Once it appears, click it and the package will be installed. After the install is completed, a green check mark will appear next to the play icon.

3.2 Download Data

The screenshot shows the first two steps of the Osm2gmns quickstart.py notebook. Step 1, 'Install the osm2gmns package', is highlighted with a red box and a green checkmark, with a red arrow pointing to it and the text '1. Green check mark appears after cell operation completed'. Step 2, 'Create a network model from OpenStreetMap exports', is also highlighted with a red box and a red arrow pointing to it with the text '2. Download OSM data and then look into folder on left sidebar to see the data'. The code for step 2 is as follows:

```
[1]: 1 # Import osmgens with the alias as "og" (easier to type)
2 import osmgens as og
3 # relation id for Manhattan is 830824
4 # relation id for City of Tempe is 130833
5 og.downloadOSMData(130833, "map.osm")
6 # Generate a net from the Tempe, AZ OpenStreetMap export and include Points of Interest (POI=True)
7
```

The screenshot shows the third step of the Osm2gmns quickstart.py notebook, 'Create a network model from OpenStreetMap exports', highlighted with a red box and a red arrow pointing to it with the text '1'. The code for this step is as follows:

```
[2]: 1 # Import osmgens with the alias as "og" (easier to type)
2 import osmgens as og
3 # relation id for Manhattan is 830824
4 # relation id for City of Tempe is 130833
5 og.downloadOSMData(130833, "map.osm")
6 # Generate a net from the Tempe, AZ OpenStreetMap export and include Points of Interest (POI=True)
7
```

Below the code, the output shows the network model being visualized. A red arrow points to the output with the text '2'. The output is a map showing the network model, with a red box highlighting the map area. The map shows a grid of roads with different colors representing different road types: motorway (blue), truck (orange), primary (yellow), and secondary (green). The text 'From the data in the file, you will be able to see the 4 layers (motorway, truck, primary, and secondary) on the map.' is written in red next to the map.

3.3 Network Consolidation / Modifying

osm2gmnns_quickstart.pyrb

File Edit View Insert Runtime Tools Help Control panel/chariot

Code Text Copy to Drive

Files

- sample_data
- map.osm

4. Modify the network model

Example: Consolidate Complex Intersections

Intersections can have lots of nodes representing different turn lanes, crosswalks, etc. Using `og consolidateComplexIntersections(net)`, we can combine nodes in intersections into a single node to make analysis faster and simpler

Pay attention to this section.

```
1 og.consolidateComplexIntersections(net)
2 og.show(net)
```

osm2gmnns_quickstart.pyrb

File Edit View Insert Runtime Tools Help Control panel/chariot

Code Text Copy to Drive

Files

- sample_data
- map.osm

Example: Points of Interest

We can connect Points of Interest (POIs) to the network model. Nodes representing the center (centroids) of POIs are generated. These nodes are connected with a link to the nearest node on the rest of the network

```
1 net = og.getFromFile('map.osm', link_types=['motorway', 'trunk', 'primary', 'secondary'], RDS=True, RDS_parsing_net=False)
2 og.connectPOItoNearest(net)
3 og.show(net)
```

arguments used for network parsing:

```
{
  "filename": "map.osm",
  "network_type": "auto",
  "link_types": ["motorway", "trunk", "primary", "secondary"],
  "RDS": true,
  "RDS_parsing_net": false,
  "RDS_parsing_ratio": 0.05,
  "strict_mode": true,
  "offset": 0,
  "min_nodes": 1,
  "combine": false,
  "show": true,
  "default_lane": false,
  "default_capacity": false,
  "default_weight": 0,
  "start_node_id": 0,
  "start_link_id": 0
}
```

Building network from OSM file

reading osm file

parsing osm network

generating nodes and links

generating POIs

number of nodes: 2258, number of links: 3281, number of pois: 2122

3.4 Export/Save node, link, poi data to your local machine

5. Export transportation network model

We can export our transportation network model to a CSV format for ease of use in further analysis with other systems. `og.exportToCsv(...)` will generate two files: `node.csv` representing nodes, and `link.csv` representing links (edges) between nodes.

```

1 og.exportToCsv(nodes)
2
